(57) Abstract :

The present invention provides a computer-implemented system and method for dynamically generating personalized investment portfolios using an AI-enabled risk assessment engine integrated with a real-time market simulation environment. The system evaluates user-specific financial behavior, income conditions, risk tolerance, and long-term financial objectives through a standardized multi-parameter assessment. Based on the evaluated inputs, an AI-driven risk profiling engine classifies users into defined risk categories and dynamically constructs diversified investment portfolios aligned with such classifications. A market simulation module retrieves live stock market data and enables users to simulate portfolio performance using virtual capital prior to actual market participation. The system further adapts risk profiles and portfolio configurations based on simulated user behavior and learning progression. User data and simulation outputs are securely stored using authenticated cloud-based infrastructure. The invention achieves a technical effect by integrating behavioral risk modeling with real-time market simulation to reduce investment bias, improve financial literacy, and support informed long-term investment decision-making.
